

Ripple Reference Architecture for Mobile Money Operators

Draft v2 – Cambiste Proposal

Executive Summary

Cambiste is building a standardized integration model enabling African Mobile Money Operators to offer compliant international payments directly from their existing Mobile Money platforms.

Our objective is to combine Ripple's payment infrastructure with Cambiste's orchestration layer, allowing Mobile Money Operators to launch cross-border payment services without building or operating their own digital asset infrastructure.

This document is intended to validate the target operating model with Ripple.

Business Problem

Today, Mobile Money Operators face several barriers when offering international payments:

- Limited access to international payment infrastructure.
- Regulatory complexity for cross-border settlement.
- High operational costs of correspondent banking.
- Requirement to maintain foreign settlement infrastructure.

Ripple provides the financial infrastructure required to solve these challenges. Cambiste provides the Mobile Money integration layer.

Proposed Value Proposition

International Payments for Mobile Money Operators – Powered by Ripple

Mobile Money customers should be able to send international payments directly from their Mobile Money wallet while experiencing the same simplicity as a domestic Mobile Money transfer.

The end user should never interact with:

- Blockchain
- Stablecoins
- Digital asset wallets
- Private keys
- Custody infrastructure

These components remain entirely within the underlying Ripple infrastructure.

Target Operating Model

Party	Responsibility
Moov Money	Customer relationship, KYC, collection of funds, verification of the origin of funds and compliance applicable at the point of entry (Originator of Funds).
Cambiste	Reseller and Technical Service Provider: technical orchestration, integration of Ripple APIs, workflow management, monitoring, reconciliation and support for Mobile Money Operators.
Ripple Custody	Digital asset custody infrastructure, transaction governance, validation policies, integration of compliance controls and execution of custody operations.
Ripple Payments	Cross-border settlement and settlement orchestration.
Chainalysis / Elliptic / Notabene	Transaction screening, sanctions screening and Travel Rule, integrated into the infrastructure.
Destination Partner	Final payout to beneficiary.

Cambiste does **not** intend to operate as a Payment Service Provider, a Custodian, a Digital Asset Wallet Provider or a Financial Institution. Cambiste acts exclusively as the technology integration layer.

Reference Architecture

Flow summary

1. The **Customer** initiates a payment from their **Mobile Money Wallet**.

2. **Moov Money** handles customer onboarding, KYC, verification of the origin of funds, and collects the funds as Originator of Funds.
3. **Cambiste** provides API orchestration, workflow management, monitoring, and reconciliation.
4. **Ripple Payments** executes cross-border settlement; **Ripple Custody** governs and executes custody operations; **integrated screening providers** (Chainalysis / Elliptic / Notabene) perform transaction, sanctions and Travel Rule screening.
5. The **Destination Network** delivers the payout to the **Beneficiary**.

Compliance and Custody Governance

Ripple Custody automates a large part of the compliance controls (validation policies, integrated screening). However, when a transaction is flagged, a human review is required. The final decision therefore rests with the regulated entity operating that infrastructure, in accordance with its contractual and regulatory framework.

Publicly available documentation does not, on its own, identify which legal entity (Ripple, a subsidiary, or a partner) assumes this responsibility in every deployment. This allocation is a key point to validate contractually with Ripple.

Key Architecture Principles

1. The Mobile Money Operator remains the Originator of Funds.
2. Cambiste remains exclusively the Technical Service Provider and Reseller.
3. Ripple (or a Ripple-designated regulated custodian) provides the custody layer for digital assets used during settlement.
4. Mobile Money Operators should not be required to build or operate their own blockchain infrastructure.
5. The solution should eliminate the need for international pre-funded settlement accounts wherever supported by Ripple's payment model.

Meeting Objectives

The purpose of this meeting is to validate the following points:

1. Is this the recommended Ripple architecture for Mobile Money Operators?
2. Can Ripple provide the custody layer (or designate a regulated custodian) so that neither Moov nor Cambiste holds private keys or assumes custody responsibilities?
3. Which Ripple products constitute the recommended solution for this use case?
4. Which Ripple legal entity contracts with the Mobile Money Operator and assumes responsibility for the settlement infrastructure?
5. What partnership model does Ripple recommend for Cambiste as the Mobile Money integration partner?

Vision

Cambiste's ambition is to become Ripple's preferred Mobile Money integration partner across Africa.

By combining Ripple's financial infrastructure with Cambiste's Mobile Money expertise, operators will be able to deploy compliant international payment services significantly faster while remaining focused on customer acquisition, compliance and local operations.
